OXINDOLE DERIVATIVES

The present invention relates to oxindole derivatives, processes for their preparation, pharmaceutical compositions containing them as active ingredient, methods for the treatment of disease states associated with angiogenesis and/or increased vascular permeability, to their use as medicaments and to their use in the manufacture of medicaments for use in the production of antiangiogenic and/or vascular permeability reducing effects in warm-blooded animals such as humans.

Normal angiogenesis plays an important role in a variety of processes including embryonic development, wound healing and several components of female reproductive function. Undesirable or pathological angiogenesis has been associated with disease states including diabetic retinopathy, psoriasis, cancer, rheumatoid arthritis, atheroma, Kaposi's sarcoma and haemangioma (Fan et al, 1995, Trends Pharmacol. Sci. 16: 57-66; Folkman, 1995, Nature Medicine 1: 27-31). Alteration of vascular permeability is thought to play a role in both normal and pathological physiological processes (Cullinan-Bove et al, 1993, Endocrinology 133: 829-837; Senger et al, 1993, Cancer and Metastasis Reviews, 12: 303-324). Several polypeptides with in vitro endothelial cell growth promoting activity have been identified including, acidic and basic fibroblast growth factors (aFGF & bFGF) and vascular endothelial growth factor (VEGF). By virtue of the restricted expression of its receptors, the growth factor activity of VEGF, in contrast to that of the FGFs, is relatively specific towards endothelial cells. Recent evidence indicates that VEGF is an important stimulator of both normal and pathological angiogenesis (Jakeman et al, 1993, Endocrinology, 133: 848-859; Kolch et al, 1995, Breast Cancer Research and Treatment, 36:139-155) and vascular permeability (Connolly et al, 1989, J. Biol. Chem. 264: 20017-20024). Antagonism of VEGF action by sequestration of VEGF with antibody can result in inhibition of tumour growth (Kim et al, 1993, Nature 362: 841-844). Basic FGF (bFGF) is a potent stimulator of angiogenesis (e.g. Hayek et al, 1987, Biochem. Biophys. Res. Commun. 147: 876-880) and raised levels of FGFs have been found in the serum (Fujimoto et al, 1991, Biochem. Biophys. Res. Commun. 180: 386-392) and urine (Nguyen et al, 1993, J. Natl. Cancer. Inst. 85: 241-242) of patients with cancer.

Receptor tyrosine kinases (RTKs) are important in the transmission of biochemical signals across the plasma membrane of cells. These transmembrane molecules characteristically consist of an extracellular ligand-binding domain connected through a segment in the plasma membrane to an intracellular tyrosine kinase domain. Binding of ligand to the receptor results in stimulation of the receptor-associated tyrosine kinase activity which leads to phosphorylation of tyrosine residues on both the receptor and other intracellular molecules. These changes in tyrosine phosphorylation initiate a signalling cascade leading to a variety of cellular responses. To date, at least nineteen distinct RTK subfamilies, defined by amino acid sequence homology, have been identified. One of these subfamilies is presently comprised by the *fms*-like tyrosine kinase receptor, Flt or Flt1, the kinase insert domain-containing receptor, KDR (also referred to as Flk-1), and another *fms*-like tyrosine kinase receptor, Flt4. Two of these related RTKs, Flt and KDR, have been shown to bind VEGF with high affinity (De Vries et al, 1992, Science 255: 989-991; Terman et al, 1992, Biochem. Biophys. Res. Comm. 1992, 187: 1579-1586). Binding of VEGF to these receptors expressed in heterologous cells has been associated with changes in the tyrosine phosphorylation status of cellular proteins and calcium fluxes.

The present invention is based on the discovery of compounds that surprisingly inhibit the effects of VEGF and FGF, properties of value in the treatment of disease states associated with angiogenesis and/or increased vascular permeability such as cancer, diabetes, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, arterial restenosis, autoimmune diseases, acute inflammation and ocular diseases with retinal vessel proliferation. Compounds of the present invention possess higher potency against VEGF receptor tyrosine kinase and against FGF R1 receptor tyrosine kinase than against epidermal growth factor (EGF) receptor tyrosine kinase. Furthermore, compounds of the present invention, possess substantially higher potency against VEGF receptor tyrosine kinase and against FGF R1 receptor tyrosine kinase than against EGF receptor tyrosine kinase. Compounds of the invention which have been tested possess activity against VEGF receptor tyrosine kinase and against FGF R1 receptor tyrosine kinase such that they may be used in an amount sufficient to inhibit VEGF receptor tyrosine kinase and FGF R1 receptor tyrosine kinase whilst demonstrating no significant activity against EGF receptor tyrosine kinase. Thus compounds of the present invention possess good VEGF receptor tyrosine

kinase activity and good FGF R1 receptor tyrosine kinase activity. Compounds with both VEGF receptor tyrosine kinase activity and FGF R1 receptor tyrosine kinase activity are believed to be of particular value in the treatment of disease states associated with angiogenesis and/or increased vascular permeability.

For the avoidance of doubt it is to be understood that where in this specification a group is qualified by 'hereinbefore defined' or 'defined hereinbefore' the said group encompasses the first occurring and broadest definition as well as each and all of the preferred definitions for that group.

30 In this specification unless stated otherwise the term "alkyl" includes both straight and branched chain alkyl groups but references to individual alkyl groups such as "propyl" are

specific for the straight chain version only. An analogous convention applies to other generic terms. Unless otherwise stated the term "alkyl" advantageously refers to chains with 1-6 carbon atoms, preferably 1-4 carbon atoms. The term "alkoxy" as used herein, unless stated otherwise includes "alkyl"-O- groups in which "alkyl" is as hereinbefore defined. The term

5 "aryl" as used herein unless stated otherwise includes reference to a C₆₋₁₀ aryl group which may, if desired, carry one or more substituents selected from halogeno, alkyl, alkoxy, nitro, trifluoromethyl and cyano, (wherein alkyl and alkoxy are as hereinbefore defined). The term "aryloxy" as used herein unless otherwise stated includes "aryl"-O-groups in which "aryl" is as hereinbefore defined. The term "sulphonyloxy" as used herein refers to alkylsulphonyloxy

10 and arylsulphonyloxy groups in which "alkyl" and "aryl" are as hereinbefore defined. The term "alkanoyl" as used herein unless otherwise stated includes formyl and alkylC=O groups in which "alkyl" is as defined hereinbefore, for example C₂alkanoyl is ethanoyl and refers to CH₃C=O, C₁alkanoyl is formyl and refers to CHO. In this specification unless stated otherwise the term "alkenyl" includes both straight and branched chain alkenyl groups but

15 references to individual alkenyl groups such as 2-butenyl are specific for the straight chain version only. Unless otherwise stated the term "alkenyl" advantageously refers to chains with 2-5 carbon atoms, preferably 3-4 carbon atoms. In this specification unless stated otherwise the term "alkynyl" includes both straight and branched chain alkynyl groups but references to individual alkynyl groups such as 2-butyne are specific for the straight chain version only.

20 Unless otherwise stated the term "alkynyl" advantageously refers to chains with 2-5 carbon atoms, preferably 3-4 carbon atoms.

Within the present invention it is to be understood that a compound of the formula I or a salt thereof may exhibit the phenomenon of tautomerism and that the formulae drawings within this specification can represent only one of the possible tautomeric forms. It is to be

25 understood that the invention encompasses any tautomeric form which inhibits VEGF receptor tyrosine kinase activity and which inhibits FGF R1 receptor tyrosine kinase activity and is not to be limited merely to any one tautomeric form utilised within the formulae drawings. In particular the oxindole group can exist in at least two forms giving compounds of formulae I and II:

(I)

(II)

(wherein R^1 , R^2 , R^3 , m and n are as hereinbefore defined). The formulae drawings within this specification can represent only one of the possible tautomeric forms and it is to be understood that the specification encompasses all possible tautomeric forms of the compounds drawn not just those forms which it has been possible to show graphically herein.

It is also to be understood that certain compounds of the formula I and salts thereof can exist in solvated as well as unsolvated forms such as, for example, hydrated forms. It is to be understood that the invention encompasses all such solvated forms which inhibit VEGF receptor tyrosine kinase activity and inhibit FGF R1 receptor tyrosine kinase activity.

For the avoidance of any doubt, it is to be understood that when X^2 is, for example, a group of formula $-NR^{11}CO-$, it is the nitrogen atom bearing the R^{11} group which is attached to the quinazoline ring and the carbonyl (CO) group is attached to R^{10} , whereas when X^2 is, for example, a group of formula $-CONR^{12}-$, it is the carbonyl group which is attached to the quinazoline ring and the nitrogen atom bearing the R^{12} group is attached to R^{10} . A similar convention applies to the other two atom X^2 linking groups such as $-NR^{14}SO_2-$ and $-SO_2NR^{13}-$. When X^2 is $-NR^{15}-$ it is the nitrogen atom bearing the R^{15} group which is linked to the quinazoline ring and to R^{10} . An analogous convention applies to other groups. It is further to be understood that when X^2 represents $-NR^{15}-$ and R^{15} is $C_{1-3}alkoxyC_{2-3}alkyl$ it is the $C_{2-3}alkyl$ moiety which is linked to the nitrogen atom of X^2 and an analogous convention applies to other groups.

For the avoidance of any doubt, it is to be understood that in a compound of the formula I when R^{10} is, for example, a group of formula $C_{1-3}alkylX^{10}C_{1-3}alkylR^{34}$, it is the terminal $C_{1-3}alkyl$ moiety which is linked to X^2 , similarly when R^{10} is, for example, a group of formula $C_{2-3}alkenylR^{34}$ it is the $C_{2-3}alkenyl$ moiety which is linked to X^2 and an analogous convention applies to other groups. When R^{10} is a group $1-R^{34}prop-1-en-3-yl$ it is the first

carbon to which the group R^{34} is attached and it is the third carbon which is linked to X^2 and an analogous convention applies to other groups.

For the avoidance of any doubt, it is to be understood that when R^{34} carries a C_{1-4} aminoalkyl substituent it is the C_{1-4} alkyl moiety which is attached to R^{34} whereas when R^{34} carries a C_{1-4} alkylamino substituent it is the amino moiety which is attached to R^{34} and an analogous convention applies to other groups.

For the avoidance of any doubt when X^1 is C_{2-4} alkanoyl it is the carbonyl moiety which is linked to the benz ring of the oxindole group and it is the alkyl moiety which is linked to R^4 and an analogous convention applies to other groups.

The present invention relates to the compounds of formula I as hereinbefore defined as well as to the salts thereof. Salts for use in pharmaceutical compositions will be pharmaceutically acceptable salts, but other salts may be useful in the production of the compounds of formula I and their pharmaceutically acceptable salts. Pharmaceutically acceptable salts of the invention may, for example, include acid addition salts of the compounds of formula I as hereinbefore defined which are sufficiently basic to form such salts. Such acid addition salts include for example salts with inorganic or organic acids affording pharmaceutically acceptable anions such as with hydrogen halides (especially hydrochloric or hydrobromic acid of which hydrochloric acid is particularly preferred) or with sulphuric or phosphoric acid, or with trifluoroacetic, citric or maleic acid. In addition where the compounds of formula I are sufficiently acidic, pharmaceutically acceptable salts may be formed with an inorganic or organic base which affords a pharmaceutically acceptable cation. Such salts with inorganic or organic bases include for example an alkali metal salt, such as a sodium or potassium salt, an alkaline earth metal salt such as a calcium or magnesium salt, an ammonium salt or for example a salt with methylamine, dimethylamine, trimethylamine, piperidine, morpholine or tris-(2-hydroxyethyl)amine.

A compound of the formula I, or salt thereof, and other compounds of the invention (as hereinafter defined) may be prepared by any process known to be applicable to the preparation of chemically-related compounds. Such processes include, for example, those illustrated in European Patent Applications Publication Nos. 0520722, 0566226, 0602851, 0635498 and 0636608. Such processes, are provided as a further feature of the invention and are as described hereinafter. Necessary starting materials may be obtained by standard

procedures of organic chemistry. The preparation of such starting materials is described within the accompanying non-limiting Examples. Alternatively necessary starting materials are obtainable by analogous procedures to those illustrated which are within the ordinary skill of an organic chemist.

Thus the following processes (a) to (h) and (i) to (viii) constitute further features of the present invention.

Synthesis of Compounds of Formula I

(a) Compounds of the formula I and salts thereof may be prepared by the reaction of a compound of the formula III:

(III)

(wherein R³ and m are as defined hereinbefore and L¹ is a displaceable moiety), with a compound of the formula IV:

(IV)

(wherein R¹, R² and n are as defined hereinbefore) whereby to obtain compounds of the formula I and salts thereof. A convenient displaceable moiety L¹ is, for example, a halogeno, alkoxy (preferably C₁₋₄alkoxy), aryloxy or sulphonyloxy group, for example a chloro, bromo, methoxy, phenoxy, methanesulphonyloxy or toluene-4-sulphonyloxy group.

The reaction is advantageously effected in the presence of a base. Such a base is, for example, an organic amine base such as, for example, pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, morpholine, N-methylmorpholine or diazabicyclo[5.4.0]undec-7-ene, tetramethylguanidine or for example, an alkali metal or
5 alkaline earth metal carbonate or hydroxide, for example sodium carbonate, potassium carbonate, calcium carbonate, sodium hydroxide or potassium hydroxide. Alternatively such a base is, for example, an alkali metal hydride, for example sodium hydride, or an alkali metal or alkaline earth metal amide, for example sodium amide, sodium bis(trimethylsilyl)amide, potassium amide or potassium bis(trimethylsilyl)amide. The reaction is preferably effected in
10 the presence of an inert solvent or diluent, for example an ether such as tetrahydrofuran or 1,4-dioxan, an aromatic hydrocarbon solvent such as toluene, or a dipolar aprotic solvent such as N,N-dimethylformamide, N,N-dimethylacetamide, N-methylpyrrolidin-2-one or dimethylsulphoxide. The reaction is conveniently effected at a temperature in the range, for example, 10 to 150°C, preferably in the range 20 to 90°C.

15 When it is desired to obtain the acid salt, the free base may be treated with an acid such as a hydrogen halide, for example hydrogen chloride, sulphuric acid, a sulphonic acid, for example methane sulphonic acid, or a carboxylic acid, for example acetic or citric acid, using a conventional procedure.

(b) A compound of the formula I and salts thereof can be prepared by the deprotection of
20 a compound of formula V:

(V)

5

(wherein R^2 , R^3 , n and m are as hereinbefore defined and P^1 represents a protecting group).

The choice of indole protecting group P^1 is within the standard knowledge of an organic chemist, for example those included in standard texts such as "Protective Groups in Organic Synthesis" T.W. Greene and R.G.M. Wuts, 2nd Ed. Wiley 1991, including N-sulphonyl derivatives (for example, p-toluenesulphonyl), carbamates (for example, t-butyl carbonyl), N-alkyl derivatives (for example, 2-chloroethyl, benzyl) and particularly amino acetal derivatives (for example, diethoxymethyl and benzyloxymethyl). The removal of such a protecting group may be effected by any of the procedures known for such a transformation, including those reaction conditions indicated in standard texts such as that indicated

15 hereinbefore, or by a related procedure. The reaction conditions preferably being such that the unprotected derivative is produced without unwanted reactions at other sites within the starting or product compounds. For example, where the protecting group P^1 is diethoxymethyl, the transformation may conveniently be effected by treatment of the oxindole derivative with an acid (as defined hereinbefore in process (a)) preferably in the presence of a

20 protic solvent or co-solvent such as water or an alcohol, for example methanol or ethanol. Such a reaction can be effected in the presence of an additional inert solvent or diluent (as defined hereinbefore in process (a)) advantageously at a temperature in the range 0 to 100°C, conveniently in the range 20 to 90°C.

(c) Compounds of the formula I and salts thereof wherein R^1 is hydrogen may also be

25 prepared by the reduction and cyclisation of a compound of formula VI:

(VI)

(wherein R^2 , R^3 , m and n are as defined hereinbefore and Y represents cyano, carboxy or C_{1-4} alkoxycarbonyl). The reduction of the nitro group may conveniently be effected as described in process (i) hereinafter. Where Y represents carboxy or C_{1-4} alkoxycarbonyl, the cyclisation to a compound of formula I occurs spontaneously after reduction of the nitro group or may be promoted, if necessary, by heating in an inert solvent or diluent such as xylene, toluene or N,N-dimethylformamide, optionally in the presence of an acid (as described hereinbefore in process (a)), advantageously at a temperature in the range of 20 to 150°C preferably in the range 20 to 100°C. Where Y represents cyano, the cyclisation to a compound of formula I can be effected in the presence of an acid (as described hereinbefore in process (a)) or a Lewis acid, such as a haloborane derivative for example boron trifluoride, and an alcohol or thiol, such as methanol, ethanol or t-butanethiol, in an inert solvent or diluent (as defined hereinbefore in process (a)) and at a temperature in the range -20 to 50°C preferably -5 to 10°C, followed by treatment with an aqueous acid, (as defined hereinbefore in process (a)), at a temperature in the range 20 to 150°C preferably in the range 20 to 100°C.

(d) Compounds of formula I and salts thereof wherein at least one of the R^2 groups is hydroxy may also be prepared by the deprotection of a compound of formula VII:

(VII)

(wherein R^1 , R^2 , R^3 , n and m are as defined hereinbefore, P^2 represents a phenolic hydroxy protecting group and $p1$ is an integer from 1 to 4 equal to the number of protected hydroxy groups and such that $n-p1$ is equal to the number of R^2 substituents which are not protected hydroxy). The choice of phenolic hydroxy protecting group P^2 is within the standard knowledge of an organic chemist, for example those included in standard texts such as "Protective Groups in Organic Synthesis" T.W. Greene and R.G.M. Wuts, 2nd Ed. Wiley 1991, including ethers (for example, methyl, methoxymethyl, allyl, benzyl and benzyl substituted with up to 2 substituents selected from C_{1-4} alkoxy and nitro), silyl ethers (for example, t-butyldiphenylsilyl and t-butyldimethylsilyl), esters (for example, acetate and benzoate) and carbonates (for example, methyl, benzyl and benzyl substituted with up to 2 substituents selected from C_{1-4} alkoxy and nitro). The removal of such a phenolic hydroxy protecting group may be effected by any of the procedures known for such a transformation, including those reaction conditions indicated in standard texts such as that indicated hereinbefore, or by a related procedure. The reaction conditions preferably being such that the hydroxy derivative is produced without unwanted reactions at other sites within the starting or product compounds. For example, where the protecting group P^2 is benzyl, the transformation may conveniently be effected by treatment of the oxindole derivative with an acid (as defined hereinbefore in process (a)) particularly trifluoroacetic acid, preferably in the presence of an ether or thioether such as thioanisole. Such a reaction can be effected in the presence of an additional inert solvent or diluent (as defined hereinbefore in process (a)) advantageously at a temperature in the range 0 to 80°C, conveniently at about 40°C.

(e) Production of those compounds of formula I and salts thereof wherein at least one R^3 is $R^{10}X^2$ wherein R^{10} is as defined hereinbefore and X^2 is -O-, -S-, -SO₂-, -CONR¹²-, -

SO₂NR¹³- or -NR¹⁵- (wherein R¹², R¹³ and R¹⁵ each independently represents hydrogen, C₁₋₃alkyl or C₁₋₃alkoxyC₂₋₃alkyl) can be achieved by the reaction, conveniently in the presence of a base (as defined hereinbefore in process (a)) of a compound of the formula VIII:

(VIII)

(wherein R¹, R², R³, n and X² are as hereinbefore defined and s is an integer from 0 to 3) with a compound of formula IX:

(IX)

(wherein R¹⁰ and L¹ are as hereinbefore defined), L¹ is a displaceable moiety for example a halogeno or sulphonyloxy group such as a bromo or methanesulphonyloxy group. The reaction is preferably effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), advantageously at a temperature in the range, for example 10 to 150°C, conveniently at about 50°C.

(f) Compounds of the formula I and salts thereof wherein at least one R³ is R¹⁰X² wherein R¹⁰ is as defined hereinbefore and -X² is -O-, -S-, or -NR¹⁵- (wherein R¹⁵ represents hydrogen, C₁₋₃alkyl or C₁₋₃alkoxyC₂₋₃alkyl) may be prepared by the reaction of a compound of the formula X:

- 37 -

(X)

with a compound of the formula XI:

(XI)

(wherein L^1 , R^1 , R^2 , R^3 , R^{10} , n , s and X^2 are all as hereinbefore defined). The reaction may conveniently be effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), advantageously at a temperature in the range, for example 10 to 150°C, conveniently at about 100°C.

(g) Compounds of the formula I and salts thereof wherein at least one R^3 is $R^{10}X^2$ wherein X^2 is as defined hereinbefore and R^{10} is $C_{1,3}alkylR^{65}$, [wherein R^{65} is selected from one of the following six groups:

1) $X^{11}C_{1,3}alkyl$ (wherein X^{11} represents -O-, -S-, -SO₂-, -NR⁶⁶CO- or -NR⁶⁷SO₂- (wherein R^{66} and R^{67} which may be the same or different are each hydrogen, $C_{1,3}alkyl$ or $C_{1,3}alkoxyC_{2,3}alkyl$);

2) $NR^{68}R^{69}$ (wherein R^{68} and R^{69} which may be the same or different are each hydrogen, $C_{1,3}alkyl$ or $C_{1,3}alkoxyC_{2,3}alkyl$);

3) $X^{12}C_{1,3}alkylX^6R^{27}$ (wherein X^{12} represents -O-, -S-, -SO₂-, -NR⁷⁰CO-, -NR⁷¹SO₂- or NR⁷² (wherein R^{70} , R^{71} , and R^{72} which may be the same or different are each hydrogen, $C_{1,3}alkyl$ or $C_{1,3}alkoxyC_{2,3}alkyl$) and X^6 and R^{27} are as defined hereinbefore);

4) R^{60} (wherein R^{60} is as defined hereinbefore);

5) $X^{13}R^{34}$ (wherein X^{13} represents -O-, -S-, -SO₂-, -NR⁷³CO-, -NR⁷⁴SO₂-, or -NR⁷⁵- (wherein R^{73} , R^{74} , and R^{75} which may be the same or different are each hydrogen, C₁₋₃alkyl or C₁₋₃alkoxyC₂₋₃alkyl) and R^{34} is as defined hereinbefore); and

6) $X^{14}C_{1-3}alkylR^{34}$ (wherein X^{14} represents -O-, -S-, -SO₂-, -NR⁷⁶CO-, -NR⁷⁷SO₂- or -NR⁷⁸- (wherein R^{76} , R^{77} and R^{78} each independently represents hydrogen, C₁₋₃alkyl or C₁₋₃alkoxyC₂₋₃alkyl) and R^{34} is as defined hereinbefore);]

may be prepared by reacting a compound of the formula XII:

(XII)

(wherein L^1 , X^2 , R^1 , R^2 , R^3 , n and s are as hereinbefore defined) with a compound of the formula XIII:

(XIII)

(wherein R^{65} is as defined hereinbefore) to give a compound of the formula I or salt thereof. The reaction may conveniently be effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), and at a temperature in the range, for example 0 to 150°C, conveniently at about 50°C.

Processes (a)-(d) and (g) are preferred over processes (e) and (f).

(h) The production of those compounds of the formula I and salts thereof wherein one or more of the substituents $(R^3)_m$ is represented by -NR⁷⁹R⁸⁰-, where one or both of R^{79} and R^{80} are C₁₋₃alkyl, may be effected by the reaction of compounds of formula I wherein the

substituent $(R^3)_m$ is an amino group and an alkylating agent, preferably in the presence of a base as defined hereinbefore. Such alkylating agents are C_{1-3} alkyl moieties bearing a displaceable moiety as defined hereinbefore such as C_{1-3} alkyl halides for example C_{1-3} alkyl chloride, bromide or iodide. The reaction is preferably effected in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)) and at a temperature in the range, for example, 10 to 100°C, conveniently at about ambient temperature. The production of compounds of formula I and salts thereof wherein one or more of the substituents R^2 or R^3 is an amino group may be effected by the reduction of a corresponding compound of formula I wherein the substituent(s) at the corresponding position(s) of the quinazoline and/or benz ring of the oxindole group is/are a nitro group(s). The reduction may conveniently be effected as described in process (i) hereinafter. The production of a compound of formula I and salts thereof wherein the substituent(s) at the corresponding position(s) of the quinazoline and/or benz ring of the oxindole group is/are a nitro group(s) may be effected by the processes described hereinbefore and hereinafter in processes (a-g) and (i-viii) using a compound selected from the compounds of the formulae (I-XXXIII) in which the substituent(s) at the corresponding position(s) of the quinazoline and/or benz ring of the oxindole group is/are a nitro group(s).

Synthesis of Intermediates

(i) The compounds of formula III and salts thereof, constitute a further feature of the present invention. Such compounds in which L^1 is halogeno may for example be prepared by halogenating a compound of the formula XIV:

(XIV)

(wherein R^3 and m are as hereinbefore defined).

Convenient halogenating agents include inorganic acid halides, for example thionyl chloride, phosphorus(III)chloride, phosphorus(V)oxychloride and phosphorus(V)chloride. The halogenation reaction is conveniently effected in the presence of an inert solvent or

diluent such as for example a halogenated solvent such as methylene chloride, trichloromethane or carbon tetrachloride, or an aromatic hydrocarbon solvent such as benzene or toluene. The reaction is conveniently effected at a temperature in the range, for example 10 to 150°C, preferably in the range 40 to 100°C.

- 5 The compounds of formula XIV and salts thereof which constitute a further feature of the present invention may for example be prepared by reacting a compound of the formula XV:

(XV)

- 15 (wherein R³, s and L¹ are as hereinbefore defined) with a compound of the formula XI as hereinbefore defined. The reaction may conveniently be effected in the presence of a base (as defined hereinbefore in process (a)) and advantageously in the presence of an inert solvent or diluent (as defined hereinbefore in process (a)), advantageously at a temperature in the range, for example 10 to 150°C, conveniently at about 100°C.

- 20 The compounds of formula XIV and salts thereof may also be prepared by cyclising a compound of the formula XVI:

(XVI)

- 30 (wherein R³ and m, are as hereinbefore defined, and A¹ is an hydroxy, alkoxy (preferably C₁, alkoxy) or amino group) whereby to form a compound of formula XIV or salt thereof. The

cyclisation may be effected by reacting a compound of the formula XVI, where A¹ is an hydroxy or alkoxy group, with formamide or an equivalent thereof effective to cause cyclisation whereby a compound of formula XIV or salt thereof is obtained, such as [3-(dimethylamino)-2-azaprop-2-enylidene]dimethylammonium chloride. The cyclisation is conveniently effected in the presence of formamide as solvent or in the presence of an inert solvent or diluent such as an ether for example 1,4-dioxan. The cyclisation is conveniently effected at an elevated temperature, preferably in the range 80 to 200°C. The compounds of formula XIV may also be prepared by cyclising a compound of the formula XVI, where A¹ is an amino group, with formic acid or an equivalent thereof effective to cause cyclisation whereby a compound of formula XIV or salt thereof is obtained. Equivalents of formic acid effective to cause cyclisation include for example a tri-C₁₋₄alkoxymethane, for example triethoxymethane and trimethoxymethane. The cyclisation is conveniently effected in the presence of a catalytic amount of an anhydrous acid, such as a sulphonic acid for example p-toluenesulphonic acid, and in the presence of an inert solvent or diluent such as for example a halogenated solvent such as methylene chloride, trichloromethane or carbon tetrachloride, an ether such as diethylether or tetrahydrofuran, or an aromatic hydrocarbon solvent such as toluene. The cyclisation is conveniently effected at a temperature in the range, for example 10 to 100°C, preferably in the range 20 to 50°C.

Compounds of formula XVI and salts thereof, which constitute a further feature of the present invention, may for example be prepared by the reduction of the nitro group in a compound of the formula XVII:

(XVII)

(wherein R³, m and A¹ are as hereinbefore defined) to yield a compound of formula XVI as hereinbefore defined. The reduction of the nitro group may conveniently be effected by any of the procedures known for such a transformation. The reduction may be carried out, for

example, by the hydrogenation of a solution of the nitro compound in the presence of an inert solvent or diluent as defined hereinbefore in the presence of a metal effective to catalyse hydrogenation reactions such as palladium or platinum. A further reducing agent is, for example, an activated metal such as activated iron (produced for example by washing iron powder with a dilute solution of an acid such as hydrochloric acid). Thus, for example, the reduction may be effected by heating the nitro compound and the activated metal in the presence of a solvent or diluent such as a mixture of water and alcohol, for example methanol or ethanol, to a temperature in the range, for example 50 to 150°C, conveniently at about 70°C.

Compounds of the formula XVII and salts thereof which constitute a further feature of the present invention, may for example be prepared by the reaction of a compound of the formula XVIII:

(XVIII)

(wherein R^3 , s , L^1 and A^1 are as hereinbefore defined) with a compound of the formula XI as hereinbefore defined to give a compound of the formula XVII. The reaction of the compounds of formulae XVIII and XI is conveniently effected under conditions as described for process (f) hereinbefore.

Compounds of formula XVII and salts thereof wherein at least one R^3 is $R^{10}X^2$ and wherein X^2 is $-O-$, $-S-$, $-SO_2-$, $-CONR^{12}-$, $-SO_2NR^{13}-$ or $-NR^{15}-$ (wherein R^{12} , R^{13} and R^{15} each independently represents hydrogen, C_{1-3} alkyl or C_{1-3} alkoxy C_{2-3} alkyl), may for example also be prepared by the reaction of a compound of the formula XIX:

(XIX)

(wherein R^3 , s , A^1 and X^2 are as hereinbefore defined) with a compound of the formula IX as hereinbefore defined to yield a compound of formula XVII as hereinbefore defined. The reaction of the compounds of formulae XIX and IX is conveniently effected under conditions as described for process (e) hereinbefore.

The compounds of formula III and salts thereof wherein at least one R^3 is $R^{10}X^2$ and wherein X^2 is $-O-$, $-S-$, $-SO_2-$, $-CONR^{12}-$, $-SO_2NR^{13}-$ or $-NR^{15}-$ (wherein R^{12} , R^{13} and R^{15} each independently represents hydrogen, C_{1-3} alkyl or C_{1-3} alkoxy C_{2-3} alkyl), may also be prepared for example by reacting a compound of the formula XX:

(XX)

(wherein R^3 , X^2 and s are as hereinbefore defined, and L^2 represents a displaceable protecting moiety) with a compound of the formula IX as hereinbefore defined, whereby to obtain a compound of formula III in which L^1 is represented by L^2 .

A compound of formula XX is conveniently used in which L^2 represents a phenoxy group which may if desired carry up to 5 substituents, preferably up to 2 substituents, selected from halogeno, nitro and cyano. The reaction may be conveniently effected under conditions as described for process (e) hereinbefore.

The compounds of formula XX and salts thereof which constitute a further feature of the present invention may for example be prepared by deprotecting a compound of the formula XXI:

(XXI)

(wherein R^3 , P^2 , X^2 , s and L^2 are as hereinbefore defined). Deprotection may be effected by techniques well known in the literature, for example where P^2 represents a benzyl group deprotection may be effected by hydrogenolysis or by treatment with trifluoroacetic acid.

One compound of formula III may if desired be converted into another compound of formula III in which the moiety L^1 is different. Thus for example a compound of formula III in which L^1 is other than halogeno, for example optionally substituted phenoxy, may be converted to a compound of formula III in which L^1 is halogeno by hydrolysis of a compound of formula III (in which L^1 is other than halogeno) to yield a compound of formula XIV as hereinbefore defined, followed by introduction of halide to the compound of formula XIV, thus obtained as hereinbefore defined, to yield a compound of formula III in which L^1 represents halogen.

(iii) The compounds of formula V and salts thereof, constitute a further feature of the present invention, and may for example be prepared by the reaction of a compound of formula III as hereinbefore defined with a compound of the formula XXII:

(XXII)

- 5 (wherein R^2 , n and P^I are as hereinbefore defined). The reaction may for example be effected as described for process (a) hereinbefore.

The compounds of formula V and salts thereof may also be prepared by reacting a compound of formula XXIII:

 20 independently represents hydrogen, C_{1-3} alkyl or C_{1-3} alkoxy C_{2-3} alkyl), may also be prepared by reacting a compound of formula XXIV:

(XXIV)

- 5 (wherein R^2 , R^3 , X^2 , n , s and P^1 are as hereinbefore defined) with a compound of the formula IX as hereinbefore defined. The reaction may for example be effected as described for process (e) hereinbefore.

Compounds of the formula XXXII and salts thereof which constitute a further feature of the present invention may be made by reacting compounds of the formulae XXI and IV as hereinbefore defined, under the conditions described in (a) hereinbefore, to give a
 10 compound of the formula XXXII or salt thereof.

5 The identification of compounds which potentially inhibit the tyrosine kinase activity associated with the VEGF receptors such as Flt and/or KDR and which inhibit angiogenesis and/or increased vascular permeability is desirable and is the subject of the present invention. These properties may be assessed, for example, using one or more of the procedures set out below:

10 **(a) In Vitro Receptor Tyrosine Kinase Inhibition Test**

 This assay determines the ability of a test compound to inhibit tyrosine kinase activity. DNA encoding VEGF, FGF or EGF receptor cytoplasmic domains may be obtained by total gene synthesis (Edwards M, International Biotechnology Lab 5(3), 19-25, 1987) or by cloning. These may then be expressed in a suitable expression system to obtain polypeptide
15 with tyrosine kinase activity. For example VEGF, FGF and EGF receptor cytoplasmic domains, which were obtained by expression of recombinant protein in insect cells, were found to display intrinsic tyrosine kinase activity. In the case of the VEGF receptor Flt (Genbank accession number X51602), a 1.7kb DNA fragment encoding most of the cytoplasmic domain, commencing with methionine 783 and including the termination codon,
20 described by Shibuya et al (Oncogene, 1990, 5: 519-524), was isolated from cDNA and cloned into a baculovirus transplacement vector (for example pAcYM1 (see The Baculovirus Expression System: A Laboratory Guide, L.A. King and R. D. Possee, Chapman and Hall, 1992) or pAc360 or pBlueBacHis (available from Invitrogen Corporation)). This recombinant construct was co-transfected into insect cells (for example *Spodoptera frugiperda* 21(Sf21))
25 with viral DNA (eg Pharmingen BaculoGold) to prepare recombinant baculovirus. (Details of the methods for the assembly of recombinant DNA molecules and the preparation and use of recombinant baculovirus can be found in standard texts for example Sambrook et al, 1989, Molecular cloning - A Laboratory Manual, 2nd edition, Cold Spring Harbour Laboratory Press and O'Reilly et al, 1992, Baculovirus Expression Vectors - A Laboratory Manual, W. H.
30 Freeman and Co, New York). For other tyrosine kinases for use in assays, cytoplasmic fragments starting from methionine 806 (KDR, Genbank accession number L04947),

methionine 668 (EGF receptor, Genbank accession number X00588) and methionine 399 (FGF R1 receptor, Genbank accession number X51803) may be cloned and expressed in a similar manner.

For expression of cFlt tyrosine kinase activity, Sf21 cells were infected with
5 plaque-pure cFlt recombinant virus at a multiplicity of infection of 3 and harvested 48 hours later. Harvested cells were washed with ice cold phosphate buffered saline solution (PBS) (10mM sodium phosphate pH7.4, 138mM sodium chloride, 2.7mM potassium chloride) then resuspended in ice cold HNTG/PMSF (20mM Hepes pH7.5, 150mM sodium chloride, 10% v/v glycerol, 1% v/v Triton X100, 1.5mM magnesium chloride, 1mM ethylene glycol-
10 bis(β-aminoethyl ether) N,N,N',N'-tetraacetic acid (EGTA), 1mM PMSF (phenylmethylsulphonyl fluoride); the PMSF is added just before use from a freshly-prepared 100mM solution in methanol) using 1ml HNTG/PMSF per 10 million cells. The suspension was centrifuged for 10 minutes at 13,000 rpm at 4°C, the supernatant (enzyme stock) was removed and stored in aliquots at -70°C. Each new batch of stock enzyme was titrated in the
15 assay by dilution with enzyme diluent (100mM Hepes pH 7.4, 0.2mM sodium orthovanadate, 0.1% v/v Triton X100, 0.2mM dithiothreitol). For a typical batch, stock enzyme is diluted 1 in 2000 with enzyme diluent and 50μl of dilute enzyme is used for each assay well.

A stock of substrate solution was prepared from a random copolymer containing tyrosine, for example Poly (Glu, Ala, Tyr) 6:3:1 (Sigma P3899), stored as 1 mg/ml stock in
20 PBS at -20°C and diluted 1 in 500 with PBS for plate coating.

On the day before the assay 100μl of diluted substrate solution was dispensed into all wells of assay plates (Nunc maxisorp 96-well immunoplates) which were sealed and left overnight at 4°C.

On the day of the assay the substrate solution was discarded and the assay plate
25 wells were washed once with PBST (PBS containing 0.05% v/v Tween 20) and once with 50mM Hepes pH7.4.

Test compounds were diluted with 10% dimethylsulphoxide (DMSO) and 25μl of diluted compound was transferred to wells in the washed assay plates. "Total" control wells contained 10% DMSO instead of compound. Twenty five microlitres of 40mM
30 manganese(II)chloride containing 8μM adenosine-5'-triphosphate (ATP) was added to all test wells except "blank" control wells which contained manganese(II)chloride without ATP. To

start the reactions 50µl of freshly diluted enzyme was added to each well and the plates were incubated at room temperature for 20 minutes. The liquid was then discarded and the wells were washed twice with PBST. One hundred microlitres of mouse IgG anti-phosphotyrosine antibody (Upstate Biotechnology Inc. product 05-321), diluted 1 in 6000 with PBST

5 containing 0.5% w/v bovine serum albumin (BSA), was added to each well and the plates were incubated for 1 hour at room temperature before discarding the liquid and washing the wells twice with PBST. One hundred microlitres of horse radish peroxidase (HRP)-linked sheep anti-mouse Ig antibody (Amersham product NXA 931), diluted 1 in 500 with PBST containing 0.5% w/v BSA, was added and the plates were incubated for 1 hour at room
10 temperature before discarding the liquid and washing the wells twice with PBST. One hundred microlitres of 2,2'-azino-bis(3-ethylbenzthiazoline-6-sulphonic acid) (ABTS) solution, freshly prepared using one 50mg ABTS tablet (Boehringer 1204 521) in 50ml freshly prepared 50mM phosphate-citrate buffer pH5.0 + 0.03% sodium perborate (made with
1 phosphate citrate buffer with sodium perborate (PCSB) capsule (Sigma P4922) per 100ml
15 distilled water), was added to each well. Plates were then incubated for 20-60 minutes at room temperature until the optical density value of the "total" control wells, measured at 405nm using a plate reading spectrophotometer, was approximately 1.0. "Blank" (no ATP) and "total" (no compound) control values were used to determine the dilution range of test compound which gave 50% inhibition of enzyme activity.

(b) In Vitro HUVEC Proliferation Assay

This assay determines the ability of a test compound to inhibit the growth factor-stimulated proliferation of human umbilical vein endothelial cells (HUVEC).

HUVEC cells were isolated in MCDB 131 (Gibco BRL) + 7.5% v/v foetal calf
25 serum (FCS) and were plated out (at passage 2 to 8), in MCDB 131 + 2% v/v FCS + 3µg/ml heparin + 1µg/ml hydrocortisone, at a concentration of 1000 cells/well in 96 well plates. After a minimum of 4 hours they were dosed with the appropriate growth factor (i.e. VEGF 3ng/ml, EGF 3ng/ml or b-FGF 0.3ng/ml) and compound. The cultures were then incubated for 4 days at 37°C with 7.5% CO₂. On day 4 the cultures were pulsed with 1µCi/well of
30 tritiated-thymidine (Amersham product TRA 61) and incubated for 4 hours. The cells were harvested using a 96-well plate harvester (Tomtek) and then assayed for incorporation of

tritium with a Beta plate counter. Incorporation of radioactivity into cells, expressed as cpm, was used to measure inhibition of growth factor-stimulated cell proliferation by compounds.

(c) In Vivo Rat Uterine Oedema Assay

5 This test measures the capacity of compounds to reduce the acute increase in uterine weight in rats which occurs in the first 4-6 hours following oestrogen stimulation. This early increase in uterine weight has long been known to be due to oedema caused by increased permeability of the uterine vasculature and recently Cullinan-Bove and Koos (Endocrinology, 1993,133:829-837) demonstrated a close temporal relationship with increased expression of
10 VEGF mRNA in the uterus. We have found that prior treatment of the rats with a neutralising monoclonal antibody to VEGF significantly reduces the acute increase in uterine weight, confirming that the increase in weight is substantially mediated by VEGF.

 Groups of 20 to 22-day old rats were treated with a single subcutaneous dose of oestradiol benzoate (2.5µg/rat) in a solvent, or solvent only. The latter served as unstimulated
15 controls. Test compounds were orally administered at various times prior to the administration of oestradiol benzoate. Five hours after the administration of oestradiol benzoate the rats were humanely sacrificed and their uteri were dissected, blotted and weighed. The increase in uterine weight in groups treated with test compound and oestradiol benzoate and with oestradiol benzoate alone was compared using a Student T test. Inhibition
20 of the effect of oestradiol benzoate was considered significant when $p < 0.05$.

 According to a further aspect of the invention there is provided a pharmaceutical composition which comprises a compound of the formula I as defined hereinbefore or a pharmaceutically acceptable salt thereof, in association with a pharmaceutically acceptable excipient or carrier.

25 The composition may be in a form suitable for oral administration, for example as a tablet or capsule, for parenteral injection (including intravenous, subcutaneous, intramuscular, intravascular or infusion) for example as a sterile solution, suspension or emulsion, for topical administration for example as an ointment or cream or for rectal administration for example as a suppository. In general the above compositions may be prepared in a conventional manner
30 using conventional excipients.

The compositions of the present invention are advantageously presented in unit dosage form. The compound will normally be administered to a warm-blooded animal at a unit dose within the range 5-5000mg per square metre body area of the animal, i.e. approximately 0.1-100mg/kg. A unit dose in the range, for example, 1-100mg/kg, preferably 1-50mg/kg is envisaged and this normally provides a therapeutically-effective dose. A unit dose form such as a tablet or capsule will usually contain, for example 1-250mg of active ingredient.

According to a further aspect of the present invention there is provided a compound of the formula I or a pharmaceutically acceptable salt thereof as defined hereinbefore for use in a method of treatment of the human or animal body by therapy.

We have found that compounds of the present invention inhibit VEGF receptor tyrosine kinase activity and FGF R1 receptor tyrosine kinase activity and are therefore of interest for their antiangiogenic effects and/or their ability to cause a reduction in vascular permeability.

A further feature of the present invention is a compound of formula I, or a pharmaceutically acceptable salt thereof, for use as a medicament, conveniently a compound of formula I, or a pharmaceutically acceptable salt thereof, for use as a medicament for producing an antiangiogenic and/or vascular permeability reducing effect in a warm-blooded animal such as a human being.

Thus according to a further aspect of the invention there is provided the use of a compound of the formula I, or a pharmaceutically acceptable salt thereof in the manufacture of a medicament for use in the production of an antiangiogenic and/or vascular permeability reducing effect in a warm-blooded animal such as a human being.

According to a further feature of the invention there is provided a method for producing an antiangiogenic and/or vascular permeability reducing effect in a warm-blooded animal, such as a human being, in need of such treatment which comprises administering to said animal an effective amount of a compound of formula I or a pharmaceutically acceptable salt thereof as defined hereinbefore.

As stated above the size of the dose required for the therapeutic or prophylactic treatment of a particular disease state will necessarily be varied depending on the host treated, the route of administration and the severity of the illness being treated. Preferably a daily

dose in the range of 1-50mg/kg is employed. However the daily dose will necessarily be varied depending upon the host treated, the particular route of administration, and the severity of the illness being treated. Accordingly the optimum dosage may be determined by the practitioner who is treating any particular patient.

5 The antiangiogenic and/or vascular permeability reducing treatment defined hereinbefore may be applied as a sole therapy or may involve, in addition to a compound of the invention, one or more other substances and/or treatments. Such conjoint treatment may be achieved by way of the simultaneous, sequential or separate administration of the individual components of the treatment. In the field of medical oncology it is normal practice
10 to use a combination of different forms of treatment to treat each patient with cancer. In medical oncology the other component(s) of such conjoint treatment in addition to the antiangiogenic and/or vascular permeability reducing treatment defined hereinbefore may be: surgery, radiotherapy or chemotherapy. Such chemotherapy may cover three main categories of therapeutic agent:

- 15 (i) other antiangiogenic agents that work by different mechanisms from those defined hereinbefore (for example linomide, inhibitors of integrin $\alpha v \beta 3$ function, angiostatin, razoxin, thalidomide);
- (ii) cytostatic agents such as antioestrogens (for example tamoxifen, toremifene, raloxifene, droloxifene, idoxifene), progestogens (for example megestrol acetate), aromatase inhibitors
20 (for example anastrozole, letrozole, vorazole, exemestane), antiprogestogens, antiandrogens (for example flutamide, nilutamide, bicalutamide, cyproterone acetate), LHRH agonists and antagonists (for example goserelin acetate, luprolide), inhibitors of testosterone 5 α -dihydroreductase (for example finasteride), anti-invasion agents (for example metalloproteinase inhibitors like marimastat and inhibitors of urokinase plasminogen activator
25 receptor function) and inhibitors of growth factor function, (such growth factors include for example EGF, platelet derived growth factor and hepatocyte growth factor such inhibitors include growth factor antibodies, growth factor receptor antibodies, tyrosine kinase inhibitors and serine/threonine kinase inhibitors); and
- (iii) antiproliferative/antineoplastic drugs and combinations thereof, as used in medical
30 oncology, such as antimetabolites (for example antifolates like methotrexate, fluoropyrimidines like 5-fluorouracil, purine and adenosine analogues, cytosine arabinoside);

antitumour antibiotics (for example anthracyclines like doxorubicin, daunomycin, epirubicin and idarubicin, mitomycin-C, dactinomycin, mithramycin); platinum derivatives (for example cisplatin, carboplatin); alkylating agents (for example nitrogen mustard, melphalan, chlorambucil, busulphan, cyclophosphamide, ifosfamide, nitrosoureas, thiotepa); antimitotic agents (for example vinca alkaloids like vincristine and taxoids like taxol, taxotere); topoisomerase inhibitors (for example epipodophyllotoxins like etoposide and teniposide, amsacrine, topotecan).

As stated above the compounds defined in the present invention are of interest for their antiangiogenic and/or vascular permeability reducing effects. Such compounds of the invention are expected to be useful in a wide range of disease states including cancer, diabetes, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, arterial restenosis, autoimmune diseases, acute inflammation and ocular diseases with retinal vessel proliferation. In particular such compounds of the invention are expected to slow advantageously the growth of primary and recurrent solid tumours of, for example, the colon, breast, prostate, lungs and skin. More particularly such compounds of the invention are expected to inhibit the growth of those primary and recurrent solid tumours which are associated with VEGF and/or FGF, especially those tumours which are significantly dependent on VEGF and/or FGF for their growth and spread, including for example, certain tumours of the colon, breast, prostate, lung, vulva and skin.

In addition to their use in therapeutic medicine, the compounds of formula I and their pharmaceutically acceptable salts are also useful as pharmacological tools in the development and standardisation of in vitro and in vivo test systems for the evaluation of the effects of inhibitors of VEGF receptor tyrosine kinase activity and FGF R1 receptor tyrosine kinase activity in laboratory animals such as cats, dogs, rabbits, monkeys, rats and mice, as part of the search for new therapeutic agents.

It is to be understood that where the term "ether" is used anywhere in this specification it refers to diethyl ether.

The invention will now be illustrated in the following non-limiting Examples in which, unless otherwise stated:-

[(i) evaporations were carried out by rotary evaporation in vacuo and work-up procedures were carried out after removal of residual solids such as drying agents by filtration;

(ii) operations were carried out at ambient temperature, that is in the range 18-25°C and under an atmosphere of an inert gas such as argon;

(iii) column chromatography (by the flash procedure) and medium pressure liquid chromatography (MPLC) were performed on Merck Kieselgel silica (Art. 9385) or Merck Lichroprep RP-18 (Art. 9303) reversed-phase silica obtained from E. Merck, Darmstadt, Germany;

Potassium bis(trimethylsilyl)amide (5ml of a 0.5M solution in toluene, 2.5mmol) was rapidly added at ambient temperature to a solution of 4-chloro-6,7-dimethoxyquinazoline (337mg, 1.5mmol) and 1-methyloxindole (368mg, 2.5mmol), (prepared according to the method described in J. Am. Chem. Soc 1945, 67, 1656), in THF (30ml). After 30 minutes, the precipitate was collected by filtration and washed with ether. A second precipitate was isolated from the filtrate. The two solids were mixed and purified by column flash chromatography using methylene chloride/methanol (96/4 and 94/6) as eluent. During the evaporation of the solvents, the compound crystallised. The solid was filtered off, washed with ether and dried under vacuum to give 6,7-dimethoxy-4-(1-methyloxindol-3-yl)quinazoline (103mg, 20%) as red orange needles.

The starting material was prepared as follows:

A mixture of 4,5-dimethoxyanthranilic acid (19.7g) and formamide (10ml) was stirred and heated at 190°C for 5 hours. The mixture was allowed to cool to approximately 80°C and water (50ml) was added. The mixture was then allowed to stand at ambient temperature for 3 hours. The precipitate was collected by filtration, washed with water and dried to give 6,7-dimethoxy-3,4-dihydroquinazolin-4-one (3.65g).

To a portion (2.06g) of the material so obtained were added thionyl chloride (20ml) and DMF (1 drop) and the mixture stirred and heated at reflux for 2 hours. Excess thionyl chloride was removed by evaporation and the residue was partitioned between ethyl acetate and a saturated aqueous sodium hydrogen carbonate solution. The organic phase was washed with water, dried (MgSO₄) and the solvent removed by evaporation. The residue was purified by column chromatography using increasingly polar mixtures of methylene chloride and ethyl acetate as eluent to give 4-chloro-6,7-dimethoxyquinazoline (0.6g, 27%).

After 2 hours, the precipitate was filtered off and washed with ether. The filtrate was evaporated. The residue was mixed with the precipitate and partitioned between methylene chloride and water and the organic phase washed with saturated aqueous sodium chloride solution. The organic layer was dried (MgSO₄) and the solvent removed by evaporation. The residue was purified by column flash chromatography using methylene chloride/methanol (95/5) as eluent. The mixture was heated for 1 hour, the solid product was collected by filtration and purified on a Diaion (trade mark of Mitsubishi) HP20SS resin column, eluting with acetonitrile (using a gradient of 0 to 100%) in hydrochloric acid (pH2). Concentration of the fractions by evaporation gave a precipitate which was collected by filtration, washed with water to give a solid which was purified again by column flash chromatography using an increasingly polar mixture of methylene chloride/methanol (95/5 to

80/20) as eluent. After evaporation of the solvent, the resulting solid was dissolved in a minimum volume of methanol and a 2.9M solution of hydrogen chloride in ether was added to the solution. The solid was collected by filtration, washed with ether and dried under vacuum to give 4-(5-bromooxindol-3-yl)-6-methoxy-7-(2-methoxyethoxy)quinazoline as a

5 hydrochloride salt (74mg, 30%) as an orange solid.

10 A solution of 2-amino-4-fluorobenzoic acid (3g, 19.3mmol) in formamide (30ml) was heated at 150°C for 6 hours. The reaction mixture was poured onto ice/water (1/1) (250ml). The precipitated solid was collected by filtration, washed with water and dried to give 7-fluoro-3,4-dihydroquinazolin-4-one (2.6g, 82%).

15 Sodium metal (4.4g, 191mmol) was added to benzyl alcohol (100ml) at ambient temperature and the mixture stirred for 30 minutes then heated at 80°C for 1 hour. The mixture was then cooled to 40°C and 7-fluoro-3,4-dihydroquinazolin-4-one (7.8g, 47mmol), was added. The reaction mixture was stirred at 130°C for 4 hours and allowed to cool to ambient temperature and stirred for 18 hours. The solution was quenched with water (800ml) and acidified to pH3 with concentrated hydrochloric acid. The resulting precipitate was collected by filtration, washed with water and ether and dried for 4 hours at 60°C under high vacuum to give 7-benzyloxy-3,4-dihydroquinazolin-4-one (7.02g, 63 %).

25 7-Benzyloxy-3,4-dihydroquinazolin-4-one (7.0g, 27mmol) was suspended in dry DMF (50ml) and cooled to 5-10°C, then sodium hydride was added (1.22g of a 60 % suspension in mineral oil, 30mmol). The reaction mixture was allowed to return to ambient temperature and chloromethyl pivalate (4.75g, 31.5mmol) was added over 10 minutes and the mixture stirred for 1 hour. The reaction mixture was quenched with water (250ml), the aqueous phase adjusted to pH5 and extracted with ether (300ml x3). The combined ether phases were washed with brine, dried (MgSO₄) and the solvent removed by evaporation. The solid residue was triturated with isohexane, collected by filtration and dried under vacuum to give 7-benzyloxy-3-((pivaloyloxy)methyl)-3,4-dihydroquinazolin-4-one (9.1g, 90%).

7-benzyloxy-3-((pivaloyloxy)methyl)-3,4-dihydroquinazolin-4-one (8.0g, 22mmol) was dissolved in TFA (40ml) and the mixture heated at reflux for 3 hours then allowed to cool to ambient temperature and stirred for 18 hours. The TFA was removed by evaporation and the residue resuspended in a mixture of ether and aqueous sodium hydrogen carbonate solution. The solid was collected by filtration, washed with water and ether and dried at 40°C for 3 hours under high vacuum to give 7-hydroxy-3-((pivaloyloxy)methyl)-3,4-dihydroquinazolin-4-one (5.42g, 90%).

Morpholine (94g, 1.08mol) was added dropwise to a solution of 3-bromo-1-propanol (75g, 0.54mol) in toluene (750ml) and the reaction then heated at 80°C for 4 hours. 20 The starting material was prepared as follows:

 Dibenzyl malonate (55.6ml, 222mmol) was added dropwise to a suspension of sodium hydride (8.9g of a 60% suspension in mineral oil, 222mmol) in DMF under argon and the reaction mixture stirred at ambient temperature for 30 minutes. 2-Bromo-5-
25 trifluoromethyl-1-nitrobenzene (30g, 111mmol) was then added and the solution stirred for 18 hours. The reaction mixture was poured onto ice and extracted with ether (1200ml). The ether layer was washed with water, brine, dried (MgSO₄), and the solvent removed by evaporation. The resulting red oil was purified by flash chromatography eluting with methylene chloride/isohexane (1/1) to give dibenzyl (2-nitro-4-
30 trifluoromethyl)phenylmalonate as a yellow oil (30g, 57%) which crystallised on standing.

Lithium chloride (5.3g, 130mmol) and water (1.14g, 40mmol) were added to a solution of dibenzyl (2-nitro-4-trifluoromethyl)phenylmalonate (30g, 60mmol) in DMSO (500ml) under argon and the resulting solution was heated to 100°C for 4 hours. The reaction mixture was allowed to cool to ambient temperature then diluted with ethyl acetate (1000ml).

5 The organic phase was separated, washed with water, brine, dried (MgSO₄), and the solvent removed by evaporation. The resulting red oil was purified by flash chromatography eluting with ethyl acetate/isohexane (1/5) to give benzyl (2-nitro-4-trifluoromethyl)phenylacetate as a yellow solid (16.6g, 77%).

10 Tin(II)chloride dihydrate (50.8g, 230mmol) was added to a solution of benzyl (2-nitro-4-trifluoromethyl)phenylacetate (15.3g, 45mmol) in ethyl acetate (250ml), and the mixture heated at reflux for 2 hours under argon. Concentrated aqueous ammonia was added to give an aqueous phase of pH8. The mixture was stirred for 30 minutes and the insoluble material was removed by filtration through diatomaceous earth. The filtrate was purified by column chromatography eluting with isohexanes/ethyl acetate (3/2) to give 6-
15 trifluoromethyloxindole as a white solid (7.2g, 80%).

Diethyl malonate (44.6ml, 293mmol) was added dropwise over 1.5 hours to a suspension of sodium hydride (11.7g of a 60% suspension in mineral oil, 293mmol) in DMF under argon and the reaction mixture was stirred at ambient temperature for 30 minutes. The resulting solution was added dropwise over 1 hour to a solution of 2-chloro-5-cyano-1-nitrobenzene (24.3g, 133mmol) in DMF (75ml) cooled with a dry ice/acetone bath. The temperature of the cooling bath was adjusted to prevent the freezing of the red reaction mixture. After the addition was completed, the reaction was left to rise to ambient temperature over 2 hours. The resulting red solution was poured slowly into a stirred mixture of ice (100ml) and 1M hydrochloric acid (10ml). The resulting yellow precipitate was collected by filtration, washed with water until the filtrate was at pH7.0 and then dried under vacuum to give diethyl (4-cyano-2-nitrophenyl)malonate (39.6g, 97%).

Lithium chloride (10.7g, 255mmol) and water (2.3g, 127mmol) were added to a solution of diethyl (4-cyano-2-nitrophenyl)malonate (39g, 127mmol) in DMSO (700ml) under argon and the solution was heated at 100°C for 4 hours. The resulting pale yellow precipitate was collected by filtration, washed with water (100ml x4) and dried under vacuum to give ethyl (4-cyano-2-nitrophenyl)acetate (27.1g, 91%).

Iron powder (11.5g, 205.2mmol) was added to a saturated solution of ethyl (4-cyano-2-nitrophenyl)acetate (12g, 51.3mmol) in hot glacial acetic acid and the reaction mixture was stirred at 100°C for 2 hours. 10 6-Bromooxindole (800mg, 3.8mmol), (prepared as described for the starting material in Example 62), phenylboronic acid (500mg, 4.1mmol) sodium hydrogen carbonate (saturated aqueous solution, 50ml) and 1,2-dimethoxyethane (100ml) were mixed together and the solution was degassed using alternatively vacuum and argon.

The starting material was prepared as follows:

2,5-Dibromonitrobenzene (41.5g, 148mmol) was dissolved in anhydrous DMF (500ml) and sodium hydride (17.7g of a 60% suspension in mineral oil, 443mmol) was added under argon. Diethyl malonate (49.6g, 295mmol) was added dropwise over 10 minutes giving a strong exotherm (mixture rose to 60°C). The resulting dark red solution was poured slowly into 2M hydrochloric acid (1500ml) and extracted with ether (500ml x4). The organic phases were combined, washed with brine, dried (MgSO₄) and the solvent removed by evaporation. The crude oil was purified by flash chromatography eluting with isohexanes/ethyl acetate (100/0, then 95/5 and finally 80/20) to give diethyl (4-bromo-2-nitrophenyl)malonate (51g, 96%).
